

BRYAN PEST CONTROL

WATERING RECOMMENDATIONS

1. System Off: If it's raining or the grass is dormant for the winter.
2. Once a week: Usually prior to going dormant in the fall or prior to flustering in the spring. Only to supplement rainfall.
3. Twice a week: When soil temperatures are nearing 70 degrees in the spring and fall.
4. Three days a week: When temperatures reach the high 70's and mid 80's night time average.
5. Every other day: 90 degrees plus – check system often for proper coverage.
6. Daily watering - **NEVER**: If you don't believe you're getting enough water increase your water time per station.

Additional Information:

- A. Grass should receive a minimum of $\frac{1}{2}$ " – $\frac{3}{4}$ " of irrigation each watering. Lawn should always be allowed, when possible, to dry out between irrigations. Rain is included as irrigation and system should be reset to allow for drying out after rainfall.
- B. System should be checked weekly during the summer for proper coverage or possible issues.
- C. Never irrigate between the hours of 9am to 10pm. This will either scorch or cause fungus.
- D. Start system so it will be finished watering by 9am for large systems and 6am for normal systems: 65% of the water irrigated after 9am will evaporate away.
- E. Irrigation systems are designed to supplement rainfall. Pay real close attention to the system during periods of drought. It will let you know where your deficiencies are in your system.

Compliments of Steve Kisabeth
